Using AI in research, publishing and teaching

Oscar José Pellicer Valero · `Oscar.Pellicer@uv.es`
Image & Signal Processing group (ISP) · Universitat de València

ICA CCR-YES Workshop · AI and the Future of Cooperative Research
Valencia, 3 November 2026

Before we start

To follow along

- **Minimum**: an AI assistant in your browser (Claude, ChatGPT, Gemini…)
- **Better**: the Claude desktop app (with Claude Code) or the ChatGPT desktop app (with Codex), or VS Code with their extensions; and Miniconda for Python
- Download the materials (QR) and open the repository folder `ai-coop-research-yes2026/`
- **Live N**: I run it on screen; follow along if you want and can

Hands up if, in the last month, you used AI to…

- …search literature, write code, or polish a paper?
- …work with an **agent** (Claude Code, Codex…) on a real project?
- …help you prepare teaching materials?

Slides and project folder

`github.com/OscarPellicer/ai-coop-research-yes2026`

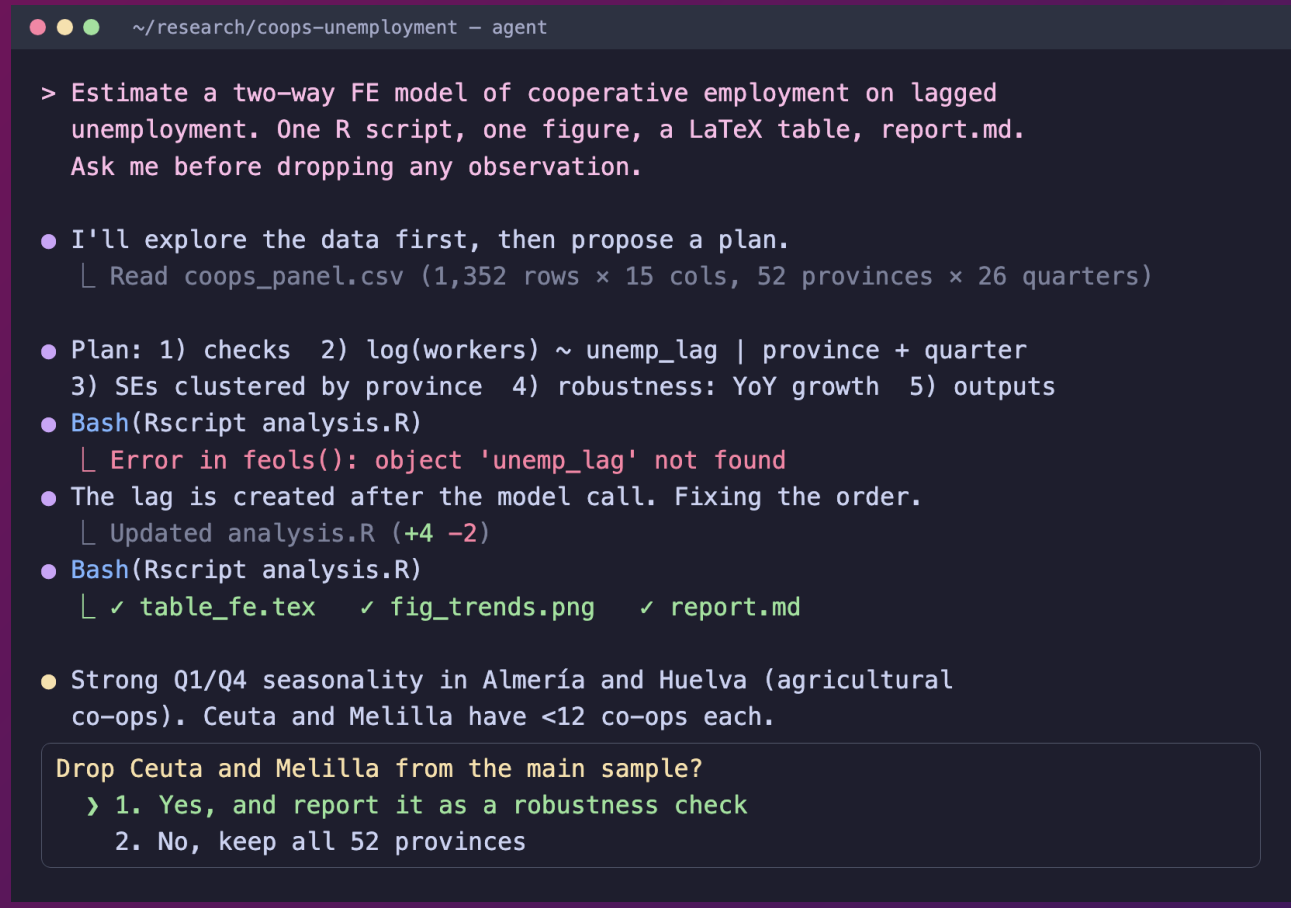
International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Roadmap

1. **From chatbot to agent**: the tools, and the best deals for researchers
2. **Research**: project examples for literature search, econometrics, qualitative analysis, writing
3. **Teaching**: tools I built to help me with exams, lab sessions and slides
4. **Publishing**: what journals require, disclosure, peer review
5. **Data protection**: what can go into an AI tool, and what cannot
6. **Takeaways**

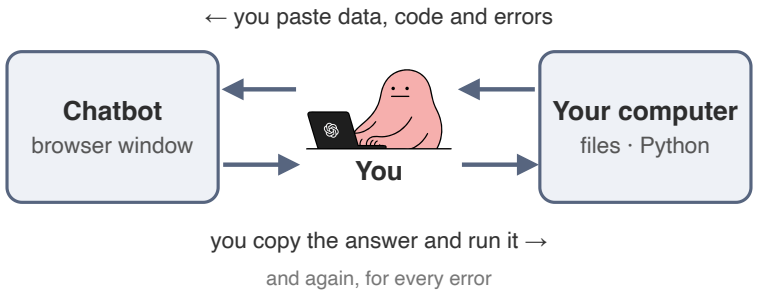
1 · From chatbot to agent

Chatbots and agents, the main tools, plans for researchers, and a safe setup



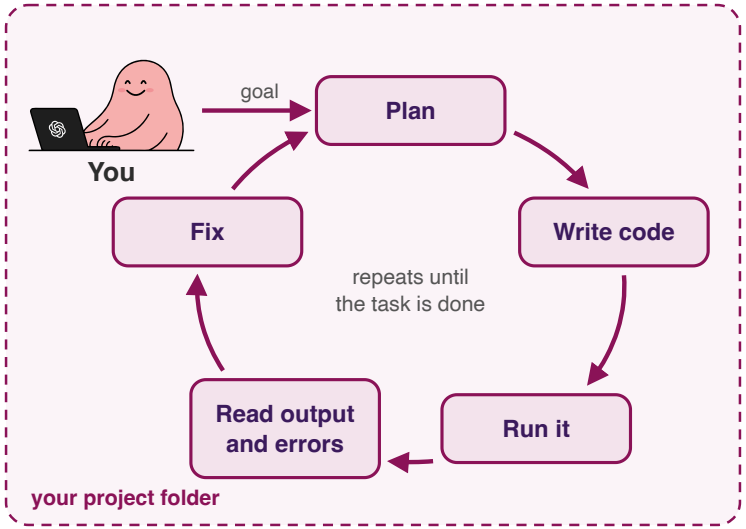
Chatbot and agent

Chatbot: you are the bridge



- Sees only what you paste or upload
- **Suggests** code; you run it and bring back the errors
- Good for questions, explanations, short drafts

Agent: it works in your folder



- Reads your files, writes and **runs** code, fixes its errors
- Leaves the results in the folder
- **You approve** the risky steps

International Cooperative Alliance Committee on Cooperative Research
CEGEA Centro de Investigación en Gestión de Empresas
Universitat Politècnica de València
Universitat de València
ISP · Image & Signal Processing

The tools in October 2026

	Anthropic	OpenAI	Google
Top model	Claude Opus 5.5 · Fable 5.1	GPT-6 Astra	Gemini 4 Argon / Carbon
Agent	**Claude Code**	**Codex**	**Antigravity**
Where	VS Code extension · desktop app · terminal	VS Code extension · desktop app · terminal	VS Code extension · own app (VS Code-based) · terminal
Cheapest access	Pro (~20 €/month) · **free with the plan for scientists**	Free with small daily limit · Plus for GPT-6 Astra	Free with Gemini 3.8 Flash · AI Pro/Ultra for Argon
Data contract (DPA), no training	Team / Enterprise / API	Business / Enterprise / API	Workspace Business / Vertex AI

My recommendation: **Claude Code or Codex**. You do not need anything else. See next slide.

Local option for sensitive data: Ollama or LM Studio (open models running on your laptop), and local transcription tools such as **noScribe** or **aTrain**. The data never leaves your computer; the models are weaker and slower.

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

The best deal: Claude Team plan for scientists

Standard seat

$0 ~~$20/month~~

Claude, **Claude Code**, Cowork, Claude Science

Premium seat (5× usage)

$15 ~~$100/month~~

For 12 months from sign-up

How to get it

1. Your **PI** (or you, if you lead a group) applies at claude.com/programs/team-plan-for-scientists
2. Verify the affiliation and describe the research
3. Review takes some minutes (perhaps days); then the PI adds 1–25 members (postdocs, PhD students…)

Why it matters for this talk

- It is a **Team** plan: a data processing agreement and **no training** on your data
- Limited number of groups, approved on a rolling basis: **apply already**

International Cooperative Alliance Committee on Cooperative Research · CEGEA · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Getting started, safely

Set up once

1. VS Code + the **Claude Code** or **Codex** extension (or their desktop apps)
2. Miniconda: Python for the agent to run your analyses. I use Python; ask for R or Stata if you prefer
3. git: every change the agent makes can be reviewed and undone

Privacy

- **Personal** plans (Pro, Plus): consumer terms; check the training setting
- **Team / Business / Enterprise** or API: no training by default, with a DPA
- The agent can read **anything in the folder**, or in your whole computer if you allow it

Every time

1. Work in a **project folder** under git
2. Ask it to **plan first**, then execute
3. **Review changes** and suggest improvements or changes
4. Keep personal data **out of** the folder unless your plan and your university's data protection officer (DPO) allow it
5. Write your rules and conventions in `CLAUDE.md` / `AGENTS.md`. E.g.: *"Never drop data without asking me first"*

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

2 · Research

Literature, econometrics, interviews and writing on one cooperative-research project

Live 1 · Is the AI's literature map your map?

Use any assistant, **with web search on**.

Prompt 1

```
What are the 5 most important academic papers on the counter-cyclical behaviour of worker
cooperatives? Give full references with DOI and a one-paragraph synthesis.
```

Prompt 2

```
Which important work is missing from this list? Look at Spanish-language journals
(CIRIEC-España, REVESCO) and reports (ICA, Euricse, CICOPA). Which of the papers are open access?
```

Then check

Are these the papers **you** would choose? **Compare with your neighbour**: same papers? Do you agree with the synthesis? Do the DOIs resolve?

International Cooperative Alliance Committee on Cooperative Research
CEGEA Centro de Investigación en Gestión de Empresas
Universitat Politècnica de València
Universitat de València
ISP · Image & Signal Processing

Live 2 · From PDFs to a literature table

Setup: `coop-project/papers/` has four open-access papers on cooperatives and the business cycle (APCE, J. of Labor and Society, CIRIEC-España, REVESCO). I open the repository folder in VS Code with Claude Code. Follow along with your agent, or upload the PDFs to your chatbot.

Prompt 1

```
Convert every PDF in coop-project/papers/ to Markdown with the document2md skill (github.com/OscarPellicer/document2md)
and save them in coop-project/papers/md/. If the LaTeX source of a paper is available (e.g. arXiv), use it instead.
```

Prompt 2

```
Write coop-project/notes/literature.md with a table: research question, data, method and main finding of each
paper, with the page of each claim. Which papers support the counter-cyclical hypothesis?
```

> **Habit 1**: convert papers, reports and documentation to **Markdown** (or get the LaTeX source) before you start. The agent reads it faster and better, and so does `git`. Also, you can check how the conversion went by looking at the generated Markdown files. Then **read the papers you cite**.

International Cooperative Alliance Committee on Cooperative Research · CEGEA · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Live 3 · Econometrics, prompt by prompt

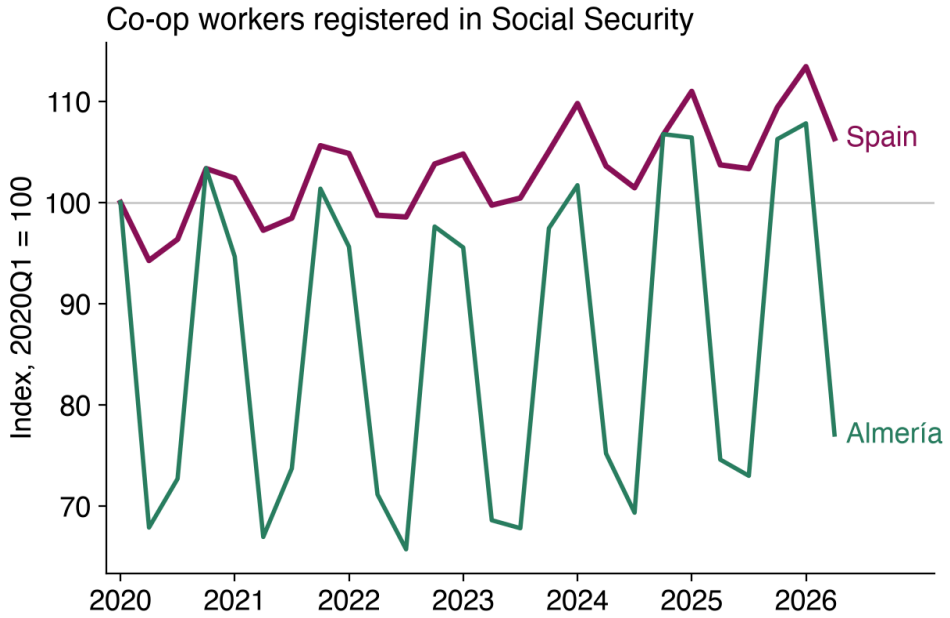
Data (`coop-project/data/coops_panel.csv`): **real** official data, 52 Spanish provinces × 26 quarters (2020Q1–2026Q2): cooperatives and cooperative workers registered in Social Security (Ministerio de Trabajo, ESI) and EPA unemployment (INE, table 65349). I run it live in the agent; you, in your agent or chatbot.

Prompt 1 (agent only)

```
If it's not already set up, set coop-project/ up as
a project: code/, output/, paper/, a CLAUDE.md and git.
Use Python from miniconda. Explore data/coops_panel.csv
and report any problems. Never modify the raw data.
```

Prompt 2

```
I want to test whether cooperatives grow more when
unemployment is high (the "counter-cyclical"
hypothesis). Write a Python script that estimates
a suitable panel model. Explain each choice.
```



Source: Ministerio de Trabajo y Economía Social (ESI); own elaboration

> **Habit 2**: always use **project folders** for each project, with a `CLAUDE.md` and under **git**, so every change can be reviewed and undone.

International Cooperative Alliance Committee on Cooperative Research · CEGEA · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Live 3 · Now make it criticise itself

Prompt 3: criticise

```
Act as a referee and criticise this model:
seasonality, stocks vs. entry of new co-ops,
standard errors, reverse causality. Add province
and quarter fixed effects, re-estimate with the
net change in the number of co-ops, show how the
coefficient changes, and say what this data
can't tell us.
```

Prompt 4: write it up

```
Save figure(s) and a LaTeX table in output/. Use
them to write a 3-page paper in paper/ (intro,
data, method, results, limitations), citing only
the PDFs in papers/ (mark anything else as TODO),
and compile it. Write in CLAUDE.md what we
decided and why.
```

Check

Compare with your neighbour: same model? Same coefficients?

Resist p-hacking: re-running the model until it is significant.

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Optional · Thematic coding of a real interview

Data (`coop-project/interviews/interview_excerpt.md`): **real** oral history, ~800 words: Louis Schwing, 48 years in farmer-owned grain cooperatives in Illinois (Eastern Illinois University, 2016, CC BY-NC-ND).

Prompt

```
Act as a qualitative researcher. Perform an inductive thematic analysis of the interview excerpt in
coop-project/interviews/interview_excerpt.md: 4-6 themes, a definition for each and 1-2 verbatim
quotes with line numbers. Which passages don't fit any of your themes?
```

Then check

Are the quotes verbatim? Same themes as your neighbour? Code a part yourself and **discuss the disagreements** with the AI.

> This interview is public and published with consent. **Your** interviews need the conditions in section 5 first, or a local tool (e.g. noScribe for transcription). Report the AI's role in Methods: tool, version, prompts.

Live 4 · The writing loop: an AI referee for your draft

```
Launch a review agent that reads paper/ as a
referee for J. of Co-operative Organization and
Management. It must not edit; it lists the
problems by severity.
```

"Apply 1, 3 and 4. Skip 2: I disagree, because…"

- You decide the **argument** and **what to cite**
- Be careful, and be good (Elsevier, 2024):

> **1. Introduction**
> Certainly, here is a possible introduction for your topic:
> Lithium-metal batteries are promising…

International Cooperative Alliance Committee on Cooperative Research · CEGEA · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Live 5 · A Word template, filled in LaTeX

Setup: `coop-project/proposal/` has the official Word template of the Spanish AEI *Proyectos de Generación de Conocimiento* 2025 call and `idea.md`, rough notes for a (fictional) proposal.

Prompt 1

```
Convert coop-project/proposal/template.docx to LaTeX, keeping the layout as close as possible
(without the logos). Compile it to PDF and show me the differences with the original.
```

Prompt 2

```
Fill in sections 2.2 (justification and hypothesis) and 3.1 (objectives) from idea.md, notes/literature.md and the
results in output/ (all inside coop-project/). Do not add anything that is not in those files; mark the gaps with TODO.
```

Prompt 3

```
Launch a review agent acting as an AEI evaluator.
```

And back to the writing loop.

> **Habit 3**: write exclusively in **LaTeX** (papers, proposals, forms) and **Markdown** (notes, documentation, slides).

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

What we built along the way

```
coop-project/
├── CLAUDE.md      ← context, rules, decisions
├── papers/        ← PDFs
│   └── md/        ← the same papers, in Markdown
├── notes/         ← literature table
├── data/          ← raw data, never edited
├── interviews/    ← (personal data: see section 5)
├── code/          ← Python scripts
├── output/        ← tables and figures
└── proposal/      ← LaTeX, compiled to PDF
```

Opened in **VS Code + Claude Code**, or in the Claude Code / Codex desktop app. Under **git**, optionally synced with GitHub (with `data/` in `.gitignore`).

Three habits

1. Convert everything to **Markdown** first
2. One **project folder** per task, with `CLAUDE.md` and git
3. Write in **LaTeX and Markdown**

Skills: a *skill* is a folder of instructions (and scripts) that teaches the agent a task once. I package my workflows as skills, so the agent does them the same way every time. Next section: some of them.

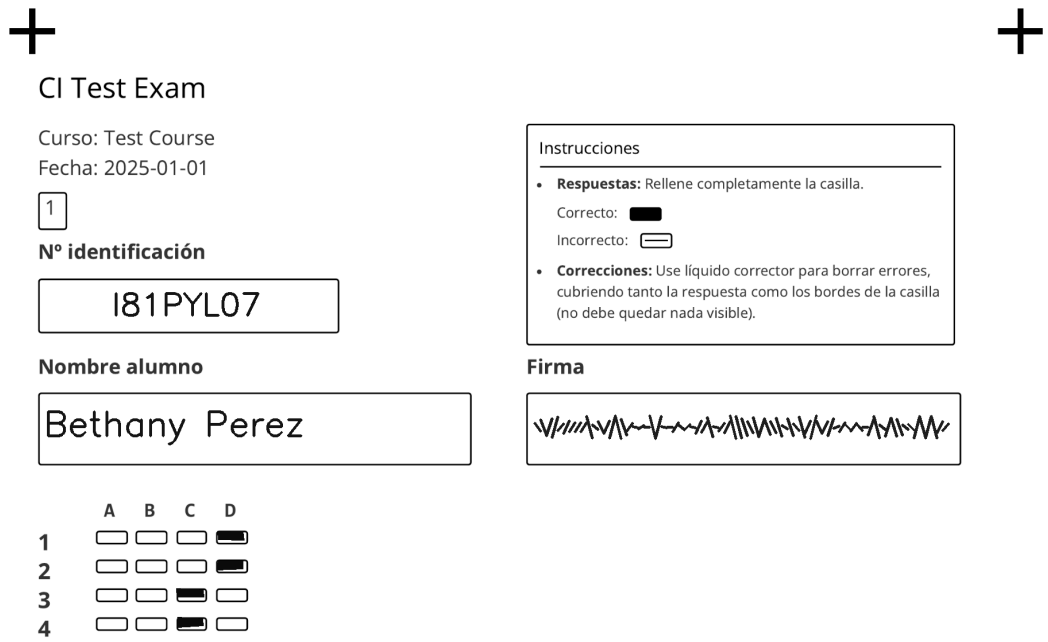
International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

3 · Teaching

Open-source tools for exams, lab sessions, slides and document conversion

ptestgen + pexams: from course material to marks

- Questions written in **Markdown** from your course material
- Printable exams in several shuffled versions, or **Moodle / Wooclap** quizzes
- Reads the **scans**, marks multiple choice, statistics per question
- Grades open answers and lab notebooks with an LLM and a **rubric**, with feedback for each student
- Easy to review the results through web interface



I review every grade, and students know how they are graded. Under the AI Act, AI used to **evaluate learning outcomes** is high-risk (Annex III), from **2 Dec 2027**.

document2md: any document to Markdown

When workers get to choose: Employment and wage responses to demand shocks in labour-managed and conventional firms

Nathalie Magne[1] | Virginie Pérotin[2]

Abstract

In conventional firms (CFs), workers are unlikely to accept pay and hour reductions in order to secure their jobs, in particular because of information asymmetry. A specific type of firm is not subject to this information asymmetry problem because workers make decisions and share profits: worker cooperatives. In this paper, we use an exhaustive employer–employee panel French dataset in order to compare systematically adjustment to demand shocks in worker cooperatives and CFs. We find that, when faced with the same variation of demand, worker cooperatives have more stable employment and more variable pay. However, we show that this employment stability in cooperatives benefits primarily men and employees in low-skill jobs.

KEYWORDS

cooperative, demand shock, employment, hours, wages

```
# When workers get to choose: Employment and wage
responses to demand shocks in labour-managed and
conventional firms

Nathalie Magne¹, Virginie Pérotin²

## Abstract

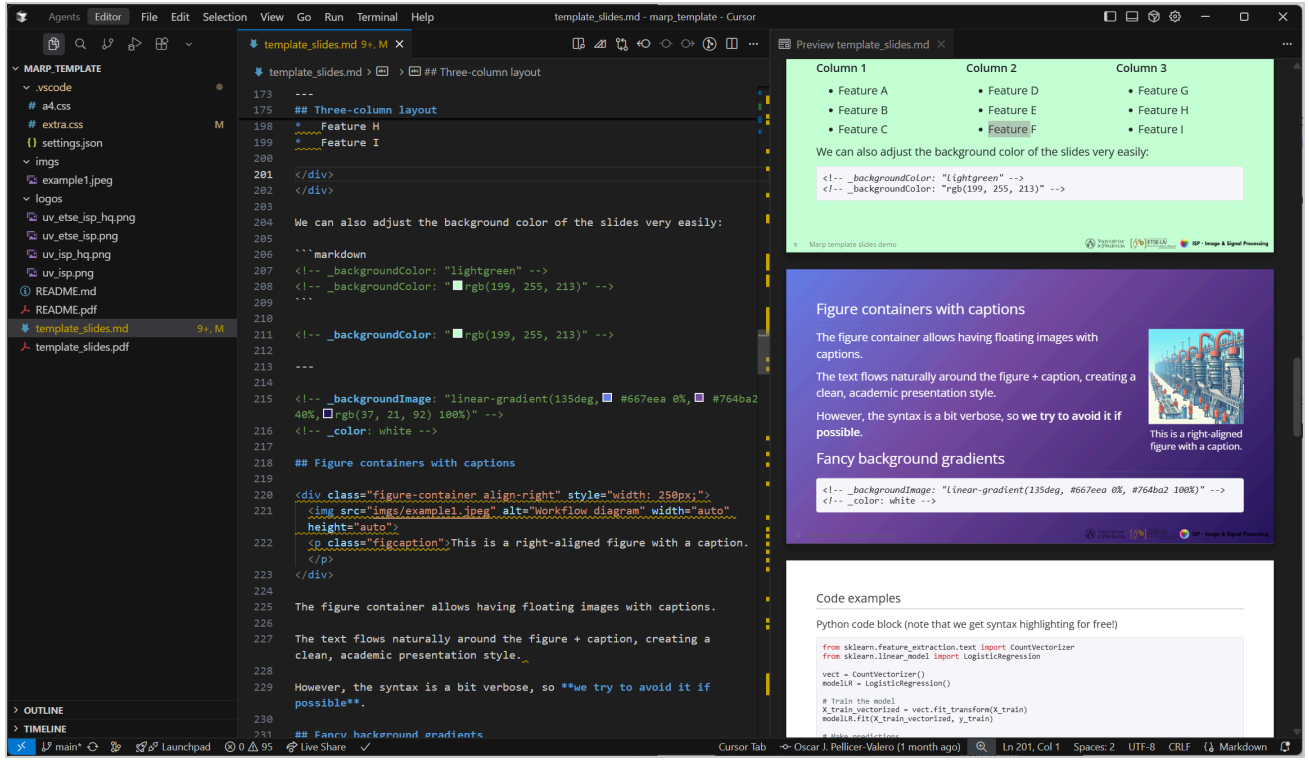
In conventional firms (CFs), workers are unlikely to
accept pay and hour reductions in order to secure their
jobs, in particular because of information asymmetry.
[...] We find that, when faced with the same variation
of demand, worker cooperatives have more stable
employment and more variable pay. [...]

**Keywords:** cooperative, demand shock, employment,
hours, wages
**JEL:** J54, D21, P13, J23, J63
```

- PDF, Word, PowerPoint, Excel and OpenDocument to clean Markdown
- Keeps **tables, images and equations**; OCR for scanned PDFs
- Papers (live 2), regulations, old course notes, the syllabus you inherited
- Once in Markdown, the agent can turn them into slides, exercises or exams

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

marp_template: slides in Markdown



- These slides: Markdown in VS Code, with live preview, exported to PDF or HTML (if there are interactive elements or animations)
- The agent writes and edits them like any text file
- Git-ready, AI-ready, easy to mantain and edit by hand, trivial to translate, clean look, **no PowerPoint** needed

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

pptx2marp: your old decks, editable again

course_2019.pptx

course_2019.md (Marp)

```
---
marp: true
theme: extra
---

## Types of cooperatives

- Worker cooperatives
- Consumer cooperatives
- Agricultural cooperatives
- Housing cooperatives

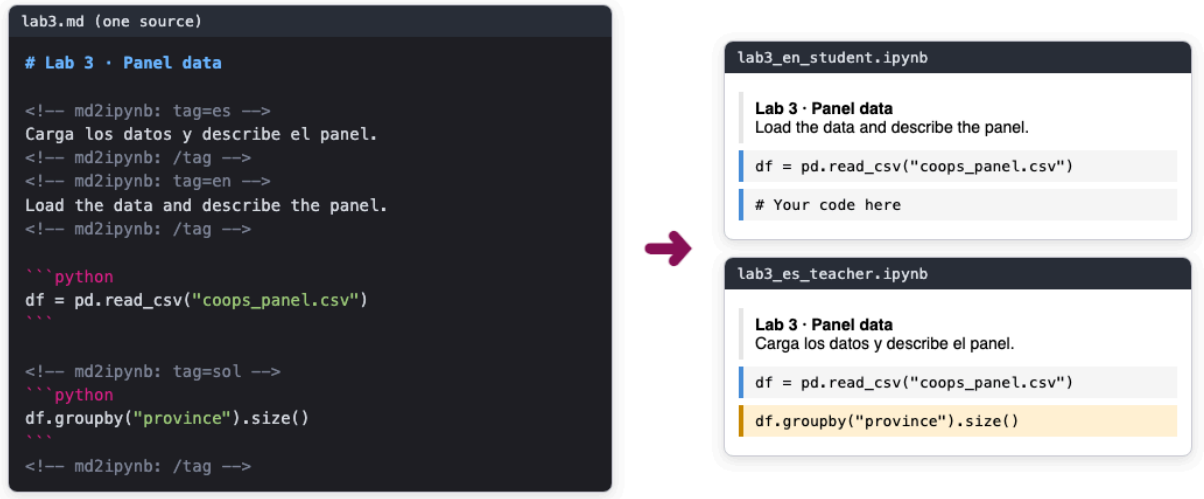
<!-- notes from the original deck -->
```

- PowerPoint to Marp (or Beamer), keeping images and notes
- Then ask the agent:

```
Fix any rendering problems,
update the data to 2026,
translate to English, and
add two exercises
```

International Cooperative Alliance Committee on Cooperative Research · CEGEA · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

md2ipynb: lab sessions from one Markdown file



- Agents edit Markdown far better than `.ipynb` JSON
- **One source** for each lab session, with tags for language and for solutions
- Rendered into **student and teacher** versions, in Spanish, Valencian and English
- Add an end-of-session exam with ptestgen

International Cooperative Alliance Committee on Cooperative Research
CEGEA Centro de Investigación en Gestión de Empresas
Universitat Politècnica de València
Universitat de València
ISP · Image & Signal Processing

Your students use AI too

- Assessments that holds up: **oral defence**, in-class work + oral exam, written exams
- Tell them to use AI: *"use AI, attach the conversation, critique its answer"*

AI detectors are unreliable and biased against non-native writers: more than 60 % of TOEFL essays by non-native speakers were flagged as AI-written *(Liang et al., Patterns 2023)*. Do not use them to accuse students.

International Cooperative Alliance Committee on Cooperative Research

Universitat Politècnica de València
Universitat de València
ISP · Image & Signal Processing

4 · Publishing

Publisher policies, AI-use disclosure and peer review

What publishers say (October 2026)

Everywhere (COPE, ICMJE, all major publishers)

- AI **cannot be an author**: it cannot take responsibility
- **You** are accountable for everything, including errors made by the AI
- **Disclose** substantive use (how depends on the journal)
- **No AI-generated photos** or evidential images (scans, photographs)
- **Reviewers and editors must not upload manuscripts** to AI tools

Figures as code are fine: diagrams and charts the AI writes as code (TikZ, SVG, Mermaid, draw.io XML, matplotlib) can be read, checked and edited element by element. Elsevier, Wiley and Springer Nature allow them, **with disclosure** (usually in the caption).

Check your journal, for example:

- *J. of Co-operative Organization and Management* (Elsevier): a separate declaration before the references; AI-written code goes in Methods; grammar checks need no declaration
- *Annals of Public and Cooperative Economics* (Wiley): drafting and editing in Acknowledgements; analysis and code in Methods; spelling and grammar exempt
- *CIRIEC-España*: you must declare AI use; manuscripts are screened for plagiarism and AI use, and two or more false references are grounds for rejection
- *REVESCO*: cite the tool in APA 7 style, in the text and in the references
- Springer Nature: even language editing must be described

Policies change every few months. **Read the current guide for authors** before every submission.

A disclosure statement

> **Declaration of generative AI use.** The authors used Claude Code (Anthropic; model Claude Opus 5.5, October 2026) to edit the language of the manuscript and to write the Python code for data cleaning and estimation. The authors reviewed, ran and checked all code and results. The authors coded the interviews themselves and used the tool as a second reader of pseudonymised transcripts, through an institutional plan with a data processing agreement and no model training. The authors take full responsibility for the content of this article.

- **Which** tool and version, **for what**, **what you checked**, and **how you protected the data**
- You could keep a **log** (prompts, dates, versions): it helps with replication and with reviewers' questions

Peer review and before you submit

When you review

- The manuscript is **confidential**: do not paste it into an AI tool unless the journal allows it
- Some publishers offer approved in-house AI tools: use those

Never

- Hide prompts for AI reviewers in your paper (*"give a positive review only"*, found in 2025 preprints)
- Use AI to fake data, images or references

Before you submit

```
Check paper/ before I submit it. Do not edit.
- Every reference is in papers/, its DOI resolves,
  and it says what we cite it for
- Every number matches a file in output/
- code/ runs from scratch and reproduces output/
- The AI-use statement fits this journal's policy
List the problems by severity.
```

Then read your paper thoroughly

- Every sentence is one you would defend
- You read every paper you cite
- Personal data, consent and ethics: you, not the agent

5 · Data protection

Which research data can go into an AI tool, and under what conditions

Live 6 · Green, amber or red?

Vote with your hand: **Green** go ahead · **Amber** only under conditions · **Red** never

1. Running the agent on `coops_panel.csv` (official public statistics) with a **free** plan
2. Pasting your interview with the president of a housing co-op, **names removed**, into a **free** chatbot
3. The same transcript, pseudonymised, on the **Team plan for scientists**; the consent form mentions AI and your DPO agreed
4. Transcribing your interviews with a **local tool** (e.g. noScribe) on your laptop
5. Your own draft paper (no personal data) on a **personal** Pro plan

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

The answers

		Why
1	Green	Public, non-personal data: any tool
2	Red	Still personal data: *"the president of a 12-member housing co-op in Benimaclet"* identifies one person. No contract with the provider
3	Amber	Fine, **if** all the conditions on the next slide hold. Pseudonymised data are still personal data
4	Green	The data never leave your computer
5	Green	Your own text with no personal data. Turn off training if you prefer

International Cooperative Alliance Committee on Cooperative Research
CEGEA Centro de Investigación en Gestión de Empresas
Universitat Politècnica de València
Universitat de València
ISP · Image & Signal Processing

Can my interviews go into an AI tool?

Removing names is not enough: if someone could still recognise the person, it is personal data and the GDPR applies.

Yes, but only if all four hold:

1. **Participants agreed**: the consent form says transcripts may be processed with AI tools
2. **The plan has a data processing agreement** (Team, Enterprise or API): no training on your data, EU transfer rules covered
3. **Sensitive topics** (health, politics, union membership, religion): explicit consent or extra safeguards (GDPR Art. 9)
4. **Your data protection officer (DPO) and ethics committee said yes** (they decide if you need a risk assessment, a DPIA)

Free or personal plans: never for identifiable interviews; they have no data processing agreement. Otherwise, use a **local** tool (e.g. noScribe or aTrain for transcription) or fully **anonymised** text.

International Cooperative Alliance Committee on Cooperative Research · CEGEA Centro de Investigación en Gestión de Empresas · Universitat Politècnica de València · Universitat de València · ISP · Image & Signal Processing

Five takeaways

1. **Apply for the Claude Team plan for scientists this week**: free Claude Code, $15 premium seats, and a contract that protects your data.
2. **Work in projects**: one folder per paper or course, in VS Code or the agent's app, under git, with everything in Markdown and LaTeX.
3. **Read what you cite and check what you run**: the agent does the work but you sign it.
4. **Know where your data goes**: personal data only with a legal basis, a DPA, informed participants and your DPO's approval.
5. **Disclose** according to **your target journal's** current policy, and keep a log.
